

Selin Uygun

Mugla, Turkey • selinjoe34@gmail.com • <https://github.com/slnuygn>
<https://www.linkedin.com/in/slnuygn> • My Portfolio: <https://slnuygn.github.io>

Software Engineer focused on backend development and cloud technologies, with practical experience designing data pipelines, automating CI/CD workflows, and containerizing applications. Proficient in modern tools including Go, Docker, and AWS, with a versatile foundation across web and mobile systems. Dedicated to building reliable, high-performance services and continuously expanding expertise in distributed cloud architectures.

Skills & Abilities

Programming: Python, Go, JavaScript, TypeScript, Dart, C#, Java (Core), CSS
Frameworks & Tools: React, Next.js, Tailwind CSS, Flutter, Docker, Firebase, PostgreSQL, Git, Postman
Languages: C1 English, A1 German

Education

Mugla Sitki Kocman University Mugla, Turkey
Software Engineering (100% English) 2021 – 2026

Certifications

DevOps Solutions (Jenkins) ID: Ko9fEpGzEV	BTK Academy 2026
Kubernetes ID: EoPfJlw2Ea	BTK Academy 2026
Cloud Computing Architectures ID: 8jmhNY6l9P	BTK Academy 2026
Dart & Flutter Mobile Development ID: 264912973	Google Skillshop 2024

Experience

Iceberg Digital UK (Remote)
Backend & DevOps Engineering Intern July 2026 – Present

- Engineered a robust data extraction pipeline using Go (go-rod, go-query) and FlareSolvrr to bypass Cloudflare protections, scraping HTML and GraphQL APIs from major UK estate agent platforms.
- Developed a centralized scraper dashboard for targeted data retrieval (by postcode, region, or specific URL) and built a responsive Next.js frontend to showcase the extracted real estate listings.
- Refactored GitHub Actions CI/CD pipelines to enforce DRY principles, centralizing PHP validation, dependency caching, and Docker/YAML linting (Hadolint, actionlint).
- Enforced strict “blast radius” and environment isolation by decoupling API (web) and Queue (background worker) deployments for AWS Elastic Beanstalk, ensuring zero-downtime updates for active users.
- Conducted comprehensive infrastructure research and cost-benefit analyses across a wide spectrum of GitHub self-hosted runner architectures (including persistent VMs, ephemeral instances, and event-driven containers) alongside diverse secure AWS authorization frameworks, presenting findings to guide critical architectural decisions.

Virtus Arge Mugla Teknopark
Web Frontend Development Intern July – August 2025

- Collaborated within a frontend team to develop a responsive, AI-powered chatbot and study application using React and Tailwind CSS.
- Connected frontend components to existing backend RESTful APIs, utilizing Postman to troubleshoot, debug, and resolve connection issues.
- Implemented secure user authentication workflows, ensuring safe token transfer and seamless frontend-backend communication during sign-in.
- Developed core application features, including an interactive document upload system, while leveraging Docker to maintain consistent development environments.

Aksoy Cozum KOU Teknopark
Enterprise Workflow Development Intern August – September 2024

- Mastered the eBA Document & Workflow Management System to design, implement, and test 10 distinct business forms and automated workflows.
- Programmed custom functions and backend logic using C# to extend the functionality of complex workflow elements.
- Utilized MSSQL on existing datasets to query, debug, and validate data integrity across all task workflows.

Projects

NeuroPAC: Integrated EEG Analysis Platform (Senior Capstone Project)

- Engineered a desktop application using Python and PyQt to automate the end-to-end pipeline for preprocessing, analyzing, and classifying EEG neuro-data (Parkinson’s).
- Classified stimuli for testing using integrated deep learning modules, implementing architectures such as EEGNet, EEG-Inception, and Riemannian classifiers.
- Designed a hybrid architecture by creating a Python executor to integrate and control MATLAB processing kernels (Fieldtrip).

- Developed modular algorithms for automated signal pre-processing and analysis, including noise filtering, artifact rejection (ICA); and ERP, time-frequency, spectral, coherence analyses.

Huddle: School Communities Mobile Application with Dart and Flutter

- Designed and implemented a school community mobile application (social media clone) with custom UI/UX prototyped in Figma.
- Developed a hierarchical role management system (President, Co-President, Board Member, Default User) to control access and management features.
- Implemented Google sign-in and leveraged Firebase NoSQL storage with strict security rules to maximize backend data protection.
